

International Scenario of Health Issues

The basic health issues identified by Health professionals through Scientific Research are quite significant and conversely scientific research has also provided useful solution of these problems. However the Health Problems can only be resolved by development of international strategy with the involvement of local population representatives and Government Policy making departments. Unfortunately international organizations like World Health Organization and International Children Fund are not supported by Governments, thus neither an effective International Health Strategy has been improvised not streamlined.

One of the most important issue about humanity is that it is divided into cast, creed, gender, religion, economic and regional factors, where as in modern time these factors must have been resolved. The International Health Environment involves international environment in which we are all integrated to each other and my fault or ignorance will affect all humanity. Thus an awareness has got to be generated and assistance be provided the entire world round for resolution of Health Issues.

The International Body should evaluate the type, cause and spread of all sort of diseases so that the basic health issues are identified and resolved. For this purpose a fresh International Health Organization has got to be developed that should have research laboratories generating health data and disease evolvment. Every country of the world and every human society should be part of it contributing to basic health data and resolution of basic health issues.

Our scientific achievement can only be done through effort all round the world convincing every cast, colour or creed that we are all related to each other and should share fundamental knowledge.
