

## **Human Life Organization in Accordance With Natural Environment**

Modernization is considered to be reorganization in accordance with recent discoveries on principles of laboratory discoveries. This is in accordance with utilization of modern scientific data. However it should be understood that scientific discoveries should be based on natural scientific data. The formal discoveries in zoology and botany in last century discovered the basic principles of life based on natural environment; however after First and Second World War the focus was shifted on to utilization of scientific inventions. No matter that some useful outcomes were discovered but it also led to complications in management of Human Life<sup>1</sup>.

It must be improvised that Natural Principles of Life can not be ignored; since it has led to serious complications in Health. For example the basic principle of Health was that after birth about two & half year the child was breastfed by mothers; however now a days the children are fed by synthetic milk leading to basic health complications. Even adults are advised to feed themselves on synthetic products<sup>2</sup>.

It's the responsibility of World Health Organization to reorganize the basic principles of Health by first collecting the disease data all round the world; and then utilizing the Health Departments all the world round to analyze and reorganize the basic health principles. It must be stressed that the natural format of human life must be properly rediscovered and the use of technology should be in accordance with these principles<sup>3</sup>.

If proper scientific principles are applied most of the Health issues of world can be handled and the natural environment will support Human Health<sup>4</sup>.
